

During this course, there was a lot to cover, especially learning how artificial intelligence can improve telecommunications. Through my assignments I learned that AI can analyze network traffic, predict equipment failures and also improve network performances without the need of humans. AI indeed plays an important role throughout telecommunications.

During the laboratory activities I applied AI and machine learning to solve telecommunications problems by creating simulated network traffic data and testing models such as Random Forest, ARIMA, Linear Regression, and LSTM. I compared the models using MSE, MAE, and RMSE to see which one predicted network traffic most accurately which then helped me understand how AI can recognize traffic patterns.

In the future I plan to continue using what I learned in this course as I move forward in my education and career. The knowledge and skills I gained will help me better understand telecommunications and apply AI to solve real-world problems.
