Your Answers:

1

1 / 1 point True or False

6G is expected to achieve peak data rates of up to 1 Tbps, which is approximately 50 times faster than 5G's peak data rate.

☒ True

False

2

1 / 1 point True or False

In AI-native networks, artificial intelligence is added as an optional feature on top of traditional network functions rather than being embedded in every layer.

True

☒ False

3

1 / 1 point True or False

Terahertz communications offer enormous bandwidth but face challenges such as high atmospheric absorption and limited transmission range.

☒ True

☐ False

4

1 / 1 point True or False

6G networks aim to support connection densities of up to 10 million devices per square kilometer, which is 10 times higher than 5G.

☒ True

☐ False

5

1 / 1 point True or False

In federated learning, raw data from all participants must be centralized and aggregated at a central server for model training.

☐ True

☒ False

6

1 / 1 point True or False

Reconfigurable Intelligent Surfaces (RIS) are active amplification devices that boost terahertz signals using high power consumption.

☐ True

☒ False

7

1 / 1 point True or False

The target latency for 6G networks is 0.1 milliseconds, which is 10 times faster than 5G's 1 millisecond latency.

☒ True

☐ False

8

1 / 1 point True or False

Direct-to-device satellite communication in 6G will allow smartphones to communicate directly with satellites without requiring terrestrial base stations.

☒ True

☐ False

9

1 / 1 point True or False

In distributed AI architecture, all AI processing must occur in the cloud to ensure consistency and accuracy across the network.

☐ True

☒ False

10

1 / 1 point True or False

Intent-based networking allows users or applications to express high-level goals, and AI automatically translates these into specific network configurations.

☒ True

☐ False

11

1 / 1 point True or False

Digital twin networks are virtual replicas of physical networks used for simulation, testing, and optimization before deploying changes to the real network.

☒ True

☐ False

12

1 / 1 point True or False

Federated learning eliminates all communication overhead since models are trained entirely locally without any need for information exchange.

☐ True

☒ False

13

0 / 1 point True or False

Federated learning eliminates all communication overhead since models are trained entirely locally without any need for information exchange.

☐ True

☒ False

Correct Answer: **True**

14

1 / 1 point True or False

Non-Orthogonal Multiple Access (NOMA) allows multiple users to share the same time and frequency resources, improving spectral efficiency compared to traditional orthogonal methods.

☒ True

☐ False

15

1 / 1 point True or False

6G networks are expected to achieve energy efficiency that is 100 times better than 5G networks, supporting sustainability goals.

☒ True

False

16

1 / 1 point True or False

In hierarchical federated learning, model updates are aggregated only at the central cloud server, bypassing edge nodes to reduce complexity.

True

☒ False
